

Introduction

Why Google?

Module 1 Quiz

What it means to be AI first

Two stages of ML

ML in Google products

Demo: ML in Google products

Replacing heuristics

It's all about data

Framing an ML problem

ML in applications

Pre-trained models

The ML marketplace is evolving

A data strategy

Training and serving skew

An ML strategy

Transform your business

Module 2 Quiz

Quiz: Module 2 Quiz

3 questions

Introduction

ML Surprise

The secret sauce

ML and Business Processes

The Path to ML

End of phases deep dive

Module 3 Quiz

Introduction

Machine Learning and Human Bias

Evaluating Metrics for Inclusion

Statistical Measurements and acceptable tradeoffs

Equality of Opportunity

Simulating Decisions

Finding Errors in your dataset using Facets

Module 4 Quiz

Module Introduction

Cloud Datalab

Computation and storage

Lab: Rent-a-VM

Cloud Shell

Third wave of cloud

AI Platform Notebooks and BigQuery

Machine Learning with Sara Robinson

Pre-trained ML APIs

Lab: Machine Learning APIs

Module 5 Quiz

Summary: ML Strategy

Module 2 Quiz

LATEST SUBMISSION GRADE 100%

1. Which of the following scenarios may require a supervised learning model to be retrained as a new model? 1 / 1 point

☐ The model was trained on unlabeled data and we now wish to train it on labeled data.

☐ The model was trained on labeled data and we now wish to train it on more labeled data.

☐ The model was trained on unlabeled data and we now wish to add labels to the data.

☒ The model was trained on labeled data and we now wish to correct the labels of the data.

✔ Correct

Supervised learning is done on labeled data, so we can discount all the answers that mention unlabeled data. We can also discount #2 - if a model is trained on labeled data, we can just train it on more data.

If a model is trained on data that is incorrect, we need to retrain the model as if it were a new model. If you need help, review the Two Stages of ML lecture video for the correct answer.

2. A team is preparing to develop and deploy an ML model for use on a shopping website. They have collected a little data to train the model. The team plans on gathering more data once the model is developed. Now they are ready for the next phase, training. 1 / 1 point

Which of these scenarios will most likely lead to a successful deployment of the ML model?

☐ The team should take time to focus on training the perfect model, because deployment is quick and easy.

☒ The team should take time to gather more data because the quality and architecture of the model are affected by the amount of data.

☐ The team should focus on deployment of the model. The model can be weak to start, then be improved when more user data has been accumulated.

✔ Correct

The team should take time to gather more data, because with more data, it is possible to create a simpler ML model that performs better. Review the "Two stages of ML" video if you need help.

3. An online shopping company has a team of customer representatives read emails from customers. Depending upon the content of the email, the representative routes the email to the appropriate department. 1 / 1 point

The company would like to alleviate the customer representatives task by automating it. Your team has been asked to create an app to read customer emails and determine which department should handle it.

Which of these would be a good way to structure the app (chose all that apply)?

☐ The team should develop one all-encompassing model that will scan the email content, categorize the content, and determine the appropriate team to receive the email.

☐ Team should develop several models, one for each task. They should develop these models from the ground up and not use pre-existing models, to insure the models are properly trained.

☒ The team should use several models in the app, one for each task. If there are any pre-existing models the team should use them.

✔ Correct

Yes, there are times when this is the best way to structure the app.
